Interpretation(s)

The AI-based TB detection system uses a multimodal approach combining Deep Learning analysis of the Chest X-Ray image with clinical parameter scoring (cough duration, fever, weight loss, night sweats) to arrive at a fused probability score.

AI Recommendation: TB unlikely.

DISCLAIMER: This report is generated by an AI system for clinical decision support only. It is not intended to replace professional medical diagnosis. A qualified physician should evaluate these results in the context of the patient's full clinical picture. Confirmatory tests (sputum culture, GeneXpert, TST) are recommended for definitive TB diagnosis.
